Researchers, clinical practitioners, and health policy experts have increasingly recognized that understanding social determinants of health is fundamental to the well-being of individuals.^{1,2}

Recent work has highlighted the importance of understanding the specific social hurdles patients face in the context of primary care, making social needs screenings a valuable way to assess the social determinants of health that impact a patient’s well-being.³

Social resources and supports have a foundational influence on health, disease prevention, and illness recovery across the life course. Affordable housing; neighborhood and workplace safety; school quality; water, food, and air quality; and social interactions and relationships have direct and indirect linkages to individual health outcomes and health care costs.¹

Accordingly, health care organizations across the United States are rushing to implement social needs screening tools in primary care settings. The National Academies of Sciences recently published proceedings from a workshop on investing in health-related social needs, noting that there is a lack of evidence supporting effective, efficient models of screening for and addressing social needs in clinical care.⁴ However, healthcare payment and policy shifts towards value-based and risk-based contracts are engendering novel efforts to address social needs. Some organizations have engaged commercial vendors to assist in this work.

The following page lists helpful resources for healthcare organizations interested in social needs screening.
